

PrivacyArmor

Is your personal
information
exposed on
the dark web?

**We can tell you months
before a public announcement.**

What is the dark web?

The dark web is part of the internet not indexed by search engines and not accessible through normal internet browsers. It is most commonly accessed through Tor, a dark web browser which conceals a user's location and allows them to remain anonymous. The dark web is a popular breeding ground for illicit content and activity, black markets, and hacker exchanges.

Human operatives inform PrivacyArmor

We utilize experienced human operatives who have access to the parts of the dark web where bad actors work. This allows us to procure an exclusive layer of information that we can feed back to our PrivacyArmor participants. We have the ability to alert a participant about compromised information weeks or even months before a breach is ever made public.

What makes us unique

Operative teams have access to closed forums where hackers and threat actors communicate and exchange data. This access allows operatives to hunt down targeted threats to obtain access to troves of secret information.

Dark web crawlers catch data

While human operatives interact in closed forums, bots crawl the dark web looking for everything from compromised credentials to data dumps to hacker chatter. Experts then exfiltrate files of compromised credentials from closed forums and alert participants when they're exposed.

Human operatives infiltrate organized botnets to extract keylogger information, which shows us when participant computers are infected and controlled. We alert those people so they can take the necessary actions to stop the flow of data from their computer to the botnet.
